

ALGORITHM

the solution of the test problem in pathological physiology

station - Typical pathological processes

1. Say hello
2. Read the test assignment carefully
3. Determine: what is the typical pathological process that the specific pathological situation in question refers to?
4. Mention the classification of the specific typical pathological process in question and provide an answer
5. Determine changes in homeostasis parameters (blood parameters, air, changes in the activity of blood enzymes, changes in the activity of tissue enzymes, winter parameters of gastric, pancreatic juices, urine parameters, etc.), which occur under the specific typical pathological process in question.
6. Identify the leading links of the mechanism of formation (pathogenetic mechanism) of a specific typical pathological process in question.
7. To determine the urgent aspects (seconds, minutes, hours, days, etc.) of the specific pathogenetic mechanism of the typical pathological process in question.
8. Identify the main compensatory mechanisms by which the mechanisms of sanogenesis are activated under the conditions of the typical pathological process in question.
9. Carefully review the answers to the test task.
10. Finish the answer, thank you, leave the room.
