

Station "Prevention of dental diseases. Practical skills"

Situational task № 1

During a routine examination of an 11-year-old girl in the area of the necks of 12, 11, 21, 22 teeth, plaque deposition was determined, after the removal of which chalk-like areas of enamel were found.

Tasks for the student:

1. Announce the preliminary diagnosis.
2. Perform an additional examination method to confirm the diagnosis.
